(54) Title: FOUNDRY ALLOY

## (57) Abstract

An aluminium-based alloy having 6.5 - 7.5 wt.% silicon and 0.35 - 0.50 wt.% magnesium as the major alloying elements and a method of manufacturing an article from the alloy are disclosed. The alloy is characterised by a microstructure in which  $\beta$  phase (Al<sub>5</sub>SiFe) that forms during heat treatment as a transformation product of  $\pi$  phase (Al<sub>8</sub>Si<sub>6</sub>Mg<sub>3</sub>Fe) is the sole or predominant iron-containing phase in the alloy.
